RESEARCH DOSSIER | 20 OCTOBER 2026

Remote embedded, electronics and Linux careers

An evidence-led shortlist for a Tunisia-based embedded-systems engineer looking for a more achievable career move without abandoning technical work.

Executive takeaway

Start with Linux support and junior system software. Canonical’s Associate Linux Support Engineer is the closest bridge between customer support and your embedded/Linux experience. Collabora’s embedded Linux consulting role is relevant but has serious additional OTA/BSP/upstream requirements. A “remote” tag alone never confirms Tunisia-based employment.

Scope	What you receive
19 employer-linked openings	Concise description, minimum skills, your overlap, blockers, application link and ranking
Fit score / 100	Transparent application readiness assessment; not a hiring-probability percentage
Pay evidence	Disclosed salary if published; otherwise “not disclosed,” Tunisia market references and negotiation scenarios
Apply plan	Priority batches, tailored CV proof points, quick portfolio upgrades and geographic/legal checks

Prepared using direct employer job pages and cross-checked compensation surveys. Snapshot only: openings may close without notice. No company-specific salary or hiring odds have been invented.

01 / Candidate baseline and approach

Your goal is not a prestigious job title at any cost. It is an attainable remote engineering-adjacent role with a meaningful improvement over your current working conditions and 1,500–1,600 TND net salary.

- Languages: English C1, French B2; Arabic may support roles but your formal level is not supplied.
- Relevant evidence: C/C++ embedded systems, UART/I²C/SPI, STM32, FreeRTOS, Yocto/WSL2, Ubuntu/QEMU, sensor service, MQTT, BMS hardware debugging and supplier/technical communication.
- Support advantage: Prior support experience and explaining diagnostic issues to other people.
- Evidence gap: Kernel upstream contributions, production cloud systems, OTA image rollbacks, formal software-release engineering and years of specialist Android development are not confirmed.
- Physical location: Tunisia, working remotely; “EMEA”/“worldwide” is promising but legal hiring eligibility must be confirmed employer-by-employer.

Meaning of the “fit %” shown here

This is a screening-readiness score, NOT a percentage probability of an offer. A 75/100 means relatively good documented overlap, not a 75% chance of acceptance. There are no company-specific offer rates, candidate-pool figures or verified Tunisia selection data sufficient to calculate an acceptance probability.

Assessment dimensions (each 0–20 points)

Criterion	What increases the score
Core skill overlap	Published technologies and responsibilities align with known experience.
Demonstrated evidence	GitHub projects, hands-on diagnostics, validated work output, measurable accomplishments.
Seniority accessibility	Entry/associate/mid; no hard 5+ year or specialist track record requirement.
Communication fit	English C1 and relevant consulting/support communication.
Remote geography	Global/EMEA eligibility, Tunisia confirmation or unresolved contract restriction.

Scoring is qualitative and based on a limited profile, not formal CV verification. It is only a way to compare where you should spend effort, and it may change after a CV review.

02 / Priority ranking — 19 employer-linked roles

All pay statuses are employer-disclosed salaries unless explicitly stated. In this sample, no named employer provided a numeric Tunisia salary on the job page. Thus “N/D” is honest rather than a guessed figure.

#	Company and role	Readiness	Tier	Remote	Pay
01	Canonical Associate Linux Support Engineer	86/100	A	Global	N/D
02	Canonical Junior Ubuntu Software Engineer	76/100	A	Global	N/D
03	Canonical Cloud Support Engineer	72/100	A	Global	N/D
04	Collabora Embedded Linux Consultant Engineer	68/100	A	Global	N/D
05	Canonical Linux Devices Software Engineer	64/100	B	Global	N/D
06	Canonical Linux Software Engineer - Next-Gen Silicon	63/100	B	EMEA	N/D
07	Canonical Junior Linux Kernel Engineer	59/100	B	Global	N/D
08	Canonical Embedded & Desktop Linux Systems Engineer - Optimisation	58/100	B	Global	N/D
09	Canonical Project Manager - Ubuntu Embedded Systems	57/100	B	EMEA	N/D

Tier A: first application wave. Tier B: targeted technical applications with some notable gaps. Tier C: stretch roles or conditional eligibility. Exact ordering is editorial, not a hiring forecast.

02 / Priority ranking — continued

#	Company and role	Readiness	Tier	Remote	Pay
10	Canonical Ubuntu Core Software Engineer	54/100	B	EMEA	N/D
11	Canonical Software Support Engineer	53/100	B	Global	N/D
12	Canonical Linux Devices Engineer - snapd	50/100	B	EMEA	N/D
13	Canonical Automotive & Industrial Software Engineer	47/100	B	EMEA	N/D
14	Canonical Graduate Software Engineer, Open Source & Linux	43/100	C	Global	N/D
15	Canonical Software Engineer - Edge AI	38/100	C	EMEA	N/D
16	Collabora Linux Kernel Consultant	35/100	C	Global	N/D
17	Imagine Worldwide Android Systems Engineer	32/100	C	Africa	N/D
18	Igalia Kernel Developer	30/100	C	Remote	N/D
19	Igalia Multimedia Developer	26/100	C	Remote	N/D

Important reality check

None of these roles can honestly be described as a verified high-probability hire for an individual applicant. Global remote embedded jobs are competitive. Use Tier A as a sensible shortlist, not a guarantee. Employer acceptance percentages are unknown.

03 / Tier A — first application wave

These provide the best overall overlap between known experience, English communication, early-career access and geographic possibility. They are NOT easy jobs; prepare evidence before submitting.

01. Canonical — Associate Linux Support Engineer

APPLY FIRST · Readiness 86/100 · Hiring probability: unknown

Work location: Worldwide remote / Tunisia eligibility not individually confirmed

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Own Ubuntu/Linux support cases from diagnosis to resolution: logs, networking, desktop/server and IoT, customer communication and escalation.

Published requirements: Linux troubleshooting, basic C/C++ or scripting, networking/server/cloud basics, English; travel twice yearly.

Why apply: Prior customer-support background, C/C++, Ubuntu/WSL2, Yocto/QEMU, UART and debugging are directly useful.

What could block acceptance: Need stronger real-world Linux admin/networking proof and evidence of SLA/ticket ownership; confirm travel/contract eligibility.

Best application evidence: Attach two concise Linux incident write-ups and one terminal-based troubleshooting repo.

OFFICIAL APPLICATION / FULL VACANCY

02. Canonical — Junior Ubuntu Software Engineer

APPLY FIRST · Readiness 76/100 · Hiring probability: unknown

Work location: Worldwide remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Package, integrate, test and ship Linux software; debug C/C++/Python code; improve open-source documentation.

Published requirements: STEM degree or equivalent narrative, open-source interest, C/C++/Python/Rust/Go, professional English; twice-yearly travel.

Why apply: C/C++ projects and Yocto build work make this a sensible early-career software application.

What could block acceptance: Current GitHub evidence is lab-oriented; independent upstream contributions and distribution packaging unproven.

Best application evidence: Polish Linux diagnostics project and add a tested .deb or open-source PR.

OFFICIAL APPLICATION / FULL VACANCY

03. Canonical — Cloud Support Engineer

APPLY FIRST · Readiness 72/100 · Hiring probability: unknown

Work location: Worldwide remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Solve real Linux/open-source customer incidents using support tickets, remote sessions and collaboration with engineers.

Published requirements: Technical troubleshooting, Linux/Ubuntu, customer communication; cloud technologies appear in the daily work.

Why apply: Strong support + Linux diagnostic fit; customer-facing communication may be your comparative advantage.

What could block acceptance: OpenStack/Kubernetes and production cloud support depth not documented.

Best application evidence: Complete focused Ubuntu server, SSH, TCP/IP, Docker and KVM troubleshooting labs.

OFFICIAL APPLICATION / FULL VACANCY

04. Collabora — Embedded Linux Consultant Engineer

APPLY FIRST · Readiness 68/100 · Hiring probability: unknown

Work location: Officially Remote/Anywhere; confirm Tunisia hiring route

Employer salary: Not disclosed; based on experience/location. Estimated offer: cannot confirm.

Role: Consult on U-Boot, Linux kernel, BSPs and embedded distributions; investigate integration bugs, build images, advise clients.

Published requirements: Yocto/Debian/ARM, Linux debugging, Git CI, image generation and OTA technologies (required); open-source methods.

Why apply: Yocto, ARM/STM32, UART and C/C++ are unusually relevant. English C1 helps consulting/client work.

What could block acceptance: OTA, A/B upgrades, upstream patches, image tools (wic/debos), and real BSP bring-up not yet demonstrated.

Best application evidence: Create Yocto image reproducibly; document wic image, boot flow, OTA rollback experiment.

OFFICIAL APPLICATION / FULL VACANCY

04 / Tier B — targeted technical roles

These are relevant but have gaps in deeper Linux engineering, device software or formal delivery experience. Apply selectively and tailor your projects to the posting.

05. Canonical — Linux Devices Software Engineer

TARGETED APPLICATION · Readiness 64/100 · Hiring probability: unknown

Work location: Worldwide remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Build and optimize Ubuntu on smart devices: Linux images, kernel/device stacks, performance and integration.

Published requirements: Linux development, systems programming, scripting, robust code, debugging; stronger academic track record.

Why apply: STM32/Yocto exposure and hardware-software boundary experience match the general domain.

What could block acceptance: Professional Linux device software deliverables, upstream work and advanced performance/security evidence.

Best application evidence: Publish end-to-end device image + userspace daemon + UART integration demonstration.

OFFICIAL APPLICATION / FULL VACANCY

06. Canonical — Linux Software Engineer - Next-Gen Silicon

TARGETED APPLICATION · Readiness 63/100 · Hiring probability: unknown

Work location: EMEA/worldwide remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Integrate Ubuntu with new silicon, drivers, packages, IoT and hardware enablement, collaborating with partners.

Published requirements: C/C++/Python fundamentals, Ubuntu and Linux packages, open source, partner communication.

Why apply: Electronics + Yocto + C/C++ and supplier-facing communication suit hybrid technical work.

What could block acceptance: Linux distribution packaging, upstream project participation and silicon enablement depth need stronger proof.

Best application evidence: Show a cross-compiled ARM image, kernel config change, and reproducible testing.

OFFICIAL APPLICATION / FULL VACANCY

07. Canonical — Junior Linux Kernel Engineer

TARGETED APPLICATION · Readiness 59/100 · Hiring probability: unknown

Work location: Worldwide remote / verify early-career eligibility

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Learn kernel engineering and contribute patches, regression tests, debugging and kernel delivery for Ubuntu hardware.

Published requirements: Early career/recent graduates, C or Rust, git, OS kernel fundamentals, English; global travel.

Why apply: Embedded C and Linux coursework align, particularly with a strong project-based portfolio.

What could block acceptance: Kernel patches, upstream code review and kernel debugging are not yet evidenced; junior label does not mean easy.

Best application evidence: Build a loadable .ko, debug with dmesg/strace, contribute a small upstream documentation patch.

OFFICIAL APPLICATION / FULL VACANCY

08. Canonical — Embedded & Desktop Linux Systems Engineer - Optimisation

TARGETED APPLICATION · Readiness 58/100 · Hiring probability: unknown

Work location: Worldwide remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Investigate Linux performance and silicon integration across IoT hardware, desktop and server systems.

Published requirements: Linux stack breadth, performance/debugging ability, partner integration and high-quality software engineering.

Why apply: Hands-on circuits, embedded platforms and Linux interest fit the direction.

What could block acceptance: Performance profiling and upstream kernel/user-space optimization experience not demonstrated.

Best application evidence: Benchmark an embedded target; publish baseline, bottleneck analysis and measured improvement.

OFFICIAL APPLICATION / FULL VACANCY

09. Canonical — Project Manager - Ubuntu Embedded Systems

TARGETED APPLICATION · Readiness 57/100 · Hiring probability: unknown

Work location: EMEA remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Manage delivery of Linux images on IoT/robotics devices; coordinate OEM/ODM vendors, schedules, and stakeholders.

Published requirements: End-to-end engineering delivery management, client leadership, technical familiarity with Linux/SoCs.

Why apply: Supplier coordination, technical project tracking and electronics procurement are a substantial overlap.

What could block acceptance: Formal ownership of large customer programs, budgets, contracts and project methodology unclear.

Best application evidence: Quantify supplier projects, engineering milestones, risks managed and delivered outcomes.

OFFICIAL APPLICATION / FULL VACANCY

10. Canonical — Ubuntu Core Software Engineer

TARGETED APPLICATION · Readiness 54/100 · Hiring probability: unknown

Work location: EMEA remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Develop secure, updatable embedded Linux software with Ubuntu Core and snap technology.

Published requirements: Strong Linux development, secure systems, packaging and software quality.

Why apply: Embedded architecture background and Linux/Yocto motivation are relevant.

What could block acceptance: Go/snapd, snaps, Ubuntu Core, AppArmor and production CI may be needed.

Best application evidence: Deploy a snap on Ubuntu Core, implement and test basic confinement.

OFFICIAL APPLICATION / FULL VACANCY

11. Canonical — Software Support Engineer

TARGETED APPLICATION · Readiness 53/100 · Hiring probability: unknown

Work location: Worldwide remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Handle complex Ubuntu, OpenStack, Kubernetes, storage and networking issues, potentially proposing upstream fixes.

Published requirements: Linux engineering and cloud infrastructure depth, fixes/backports and customer communication.

Why apply: Support background helps, but position is substantially more technical than entry help desk.

What could block acceptance: Production OpenStack/Kubernetes/Ceph and upstream patching experience not evidenced.

Best application evidence: Build and document OpenStack/Kubernetes mock incident responses; emphasize support cases.

OFFICIAL APPLICATION / FULL VACANCY

12. Canonical — Linux Devices Engineer - snapd

TARGETED APPLICATION · Readiness 50/100 · Hiring probability: unknown

Work location: EMEA/Americas remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Develop snapd/device packaging/security features for Ubuntu on IoT and desktop systems.

Published requirements: Professional Go/Python/C/C++ development, Linux namespaces/cgroups/AppArmor, software tests.

Why apply: C/C++ systems background and Linux skills are useful.

What could block acceptance: Professional coding depth plus snapd and Linux isolation internals not yet demonstrated.

Best application evidence: Build a tested Linux daemon and demo namespaces/cgroups/AppArmor behavior.

OFFICIAL APPLICATION / FULL VACANCY

13. Canonical — Automotive & Industrial Software Engineer

TARGETED APPLICATION · Readiness 47/100 · Hiring probability: unknown

Work location: EMEA remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Build dependable embedded/Linux software for automotive and industrial standards; verification/validation.

Published requirements: Professional C/C++/Python, complex Linux systems, automotive/industrial safety/security standards in practice.

Why apply: BMS electronics and test/validation experience closely match the industry domain.

What could block acceptance: Formal ISO 26262/IEC 61508/IEC 62443 or ASPICE and production safety software not evidenced.

Best application evidence: Translate BMS validation into a requirements-to-test traceability example.

OFFICIAL APPLICATION / FULL VACANCY

05 / Tier C — long shots and special conditions

These should not consume the bulk of your job-search time. Read the specific missing requirements carefully before applying.

14. Canonical — Graduate Software Engineer, Open Source & Linux

STRETCH / CONDITIONAL · Readiness 43/100 · Hiring probability: unknown

Work location: Worldwide remote; ONLY 2025/2026 graduates

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Graduate-wide placement into Ubuntu software teams, using Linux and languages including C/C++ and Python.

Published requirements: 2025 or 2026 graduate, exceptional academic evidence, STEM/software courses, personal projects.

Why apply: If your graduation year qualifies, embedded C and Linux work could support application.

What could block acceptance: Graduation year is unknown; if outside the explicitly named years, skip.

Best application evidence: Check graduation year before spending time on this application.

OFFICIAL APPLICATION / FULL VACANCY

15. Canonical — Software Engineer - Edge AI

STRETCH / CONDITIONAL · Readiness 38/100 · Hiring probability: unknown

Work location: EMEA remote / country terms to confirm

Employer salary: Not disclosed; location-adjusted. Estimated offer: cannot confirm.

Role: Build and ship Linux edge AI inference packages for GPUs/NPUs and embedded gateways.

Published requirements: At least 3 years professional Go/C++ software development, Linux app engineering, packaging/CI.

Why apply: Embedded systems and C++ are adjacent.

What could block acceptance: Professional software years and AI packaging experience not established.

Best application evidence: Only pursue after proving substantial professional C++ and packaging work.

OFFICIAL APPLICATION / FULL VACANCY

16. Collabora — Linux Kernel Consultant

STRETCH / CONDITIONAL · Readiness 35/100 · Hiring probability: unknown

Work location: Remote/Anywhere; EU/US-East hour preference

Employer salary: Not disclosed; location-dependent. Estimated offer: cannot confirm.

Role: Develop upstream Linux kernel patches and resolve client kernel problems at subsystem level.

Published requirements: Solid independent kernel development experience, upstream code/processes, English.

Why apply: Consulting and C/Linux interest match the general field.

What could block acceptance: Production kernel subsystem experience not evidenced; long-shot today.

Best application evidence: Treat as a 12-month skill-building destination, not your first exit application.

OFFICIAL APPLICATION / FULL VACANCY

17. Imagine Worldwide — Android Systems Engineer

STRETCH / CONDITIONAL · Readiness 32/100 · Hiring probability: unknown

Work location: Africa preferred; Tunisia unconfirmed

Employer salary: Not disclosed; 'competitive'. Estimated offer: cannot confirm.

Role: Build Android tablet firmware, device images, BSPs, factory flashing and OTA updates for education deployments.

Published requirements: At least 5 years Android/embedded Linux/firmware, MTK BSP, AOSP/Kotlin, device-tree, OTA and Android security.

Why apply: Embedded/hardware debugging, factory and supplier work may transfer.

What could block acceptance: 5+ years, MediaTek/Android vendor BSP, Java/Kotlin and AOSP experience appear to be strong barriers.

Best application evidence: Do not prioritize unless you have substantial unshared Android/BSP experience.

OFFICIAL APPLICATION / FULL VACANCY

18. Igalia — Kernel Developer

STRETCH / CONDITIONAL · Readiness 30/100 · Hiring probability: unknown

Work location: Remote friendly, international; Tunisia contract unconfirmed

Employer salary: Not disclosed; company says equal pay internally. Estimated offer: cannot confirm.

Role: Develop kernel subsystems, communicate on Linux mailing lists and contribute patches in public.

Published requirements: Prior kernel subsystem experience and open-source contributions, high autonomy, fluent English.

Why apply: Good longer-term Linux direction.

What could block acceptance: Demonstrated kernel upstream contributions not yet present.

Best application evidence: Contribute patches and build an upstream footprint before targeting.

OFFICIAL APPLICATION / FULL VACANCY

19. Igalia — Multimedia Developer

STRETCH / CONDITIONAL · Readiness 26/100 · Hiring probability: unknown

Work location: Remote-friendly; Tunisia terms unconfirmed

Employer salary: Not disclosed. Estimated offer: cannot confirm.

Role: Contribute to multimedia frameworks, browser media, embedded Linux multimedia and related libraries.

Published requirements: Software/media expertise; GStreamer/FFmpeg and codec/protocol experience highly desirable.

Why apply: Yocto + embedded Linux provides limited background overlap.

What could block acceptance: Multimedia framework and codec programming missing from known experience.

Best application evidence: Skip unless multimedia/video is a genuine interest.

OFFICIAL APPLICATION / FULL VACANCY

06 / Compensation: what is sourced vs what is a target

Because the vacancies are globally distributed and employers adjust pay to geography, U.S./EU online averages should not be converted into a Tunisia offer. Use only comparable local figures and request the actual recruiter salary band.

Published compensation evidence

Source / population	Figure (as reported)	Limitations
Levels.fyi, Tunisia software engineers	Median 31,421 TND/year total compensation from 30 submissions; updated 19 Oct 2026.	Annual total comp, not monthly net and not remote-only. Dividing by 12 = 2,618.42 TND/month total comp.
Glassdoor, Tunisia embedded software engineer	Displayed estimated 2,000–3,000 TND/month total pay; around 2,000 TND median.	Self-reported estimates, limited role/locality precision, not employer offers; scraped page has inconsistent yearly text.
Paylab, Tunisia software engineer	Survey range shown at access: roughly 1,685–7,014 TND/month gross for middle 80%.	Broad software market; figures vary by refresh and sample. Gross, not net; not a remote embedded-company benchmark.
Employers in this report	No numeric salary published on the reviewed 18 official job pages.	N/D does not mean zero. Compensation may be location-adjusted, bonuses/benefits vary.

Clickable survey references: Levels.fyi · Glassdoor · Paylab

Decision targets for you (NET TND / month)

These are YOUR possible negotiation/acceptance thresholds, not claimed company offers or estimated salaries. Compared with the current 1,500–1,600 TND net, calculate the uplift below.

Hypothetical net/month	Increase over 1,600	Increase over 1,500	Use in decision
2,200 TND	37.5%	46.7%	Only attractive if quality of life improves substantially
2,700 TND	68.8%	80.0%	Reasonable minimum target for a better technical role
3,200 TND	100.0%	113.3%	Strong improvement, if hours/benefits are fair
4,000 TND	150.0%	166.7%	Aspirational negotiation target, not salary forecast

Formula: (new monthly NET − old monthly NET) ÷ old monthly NET × 100. Example: (2,700 − 1,600) ÷ 1,600 × 100 = 68.75%. Do not compare a USD gross contractor quote directly with a TND net employee salary.

Salary question to ask before any interview process becomes lengthy

“I am based in Tunisia and would like to confirm whether the company can contract/employ me here. Could you share the salary band, payment currency, employer/contractor classification, required travel, and benefits so I can compare the net take-home value?”

07 / Tactical application strategy

Goal: improve your odds of passing the technical CV screen without spending months trying to become a kernel maintainer first.

When	Action	Evidence you will produce
Days 1–3	Apply first to Canonical Associate Linux Support Engineer and Cloud Support Engineer.	Tailored support-engineer CV; 2 Linux bug/incident examples; English communication examples.
Days 3–7	Apply for Junior Ubuntu Software Engineer and Collabora Embedded Linux Consultant.	C/C++/Yocto portfolio with build instructions, tests, UART/MQTT traces, clear diagrams.
Week 2	Shortlist 3–4 Tier B vacancies; submit only when role-specific gaps are addressed.	One Yocto image artifact; Debian packaging or Ubuntu Core snap; relevant detailed CV bullets.
Week 3	Interview practice: technical live debugging, Linux networking, low-level boot chain, customer escalation.	10 Linux incident Q&As; practical reproductions and commands.
Week 4	Follow up and review feedback; adjust job family if no screens.	Track submissions, confirmed Tunisia eligibility and reasons for rejection.

Reframe your CV as an embedded / Linux support engineer

• Headline: Embedded Systems & Linux Troubleshooting Engineer | C/C++ | Yocto | STM32 | English C1 | Remote / Tunisia.

• Project evidence #1: a Yocto image with an actual custom recipe, architecture diagram, boot log and reproducible QEMU demonstration.

• Project evidence #2: a C-based UART telemetry diagnostic tool with unit/error-case tests and short debugging notes.

• Project evidence #3: incident response summary for a power-supply/BMS debugging problem, emphasizing measurement method, root-cause hypothesis and validation (do not claim root cause confirmed if not).

• Supplier work: express coordination, documentation, issue escalation and risk control as measurable projects only if you can verify the numbers.

• Describe skills honestly: do not claim upstream kernel patches, 5+ years Android, cloud production ownership or formal safety certifications unless you can prove them.

The fastest 2-portfolio upgrade

(1) Publish a polished Yocto + UART/MQTT project showing how to reproduce, debug and test; (2) publish a Linux support playbook covering systemd service failures, file descriptors, networking, storage, permissions and common logs. These both support realistic Tier A applications.

08 / Interview preparation and career-track comparison

Your two best job families share enough skills that the same core projects can help both paths.

Linux support / customer-facing	Embedded Linux / firmware
Diagnose “service does not start”: systemctl, journalctl, permissions, dependencies.	Explain kernel → bootloader → rootfs boot sequence, and Yocto image composition.
Debug networking: IP addressing, DNS, TCP connection, routing, firewall basics.	Debug UART log corruption: baud, framing, parity, buffering and error recovery.
Use strace, dmesg, lsof, /proc, logs to identify process behavior.	Explain cross-compilation, target sysroot, DT/driver boundaries and constraints.
Write a ticket update with impact, reproduction, diagnosis, mitigation, next step.	Explain RTOS vs Linux, threads, interrupts, I²C/SPI/UART trade-offs.
Escalate responsibly and clarify customer's needs without making unverified claims.	Provide build/test evidence from GitHub, not vague assertions.

Career trade-off

• Linux support roles are a pragmatic entry that uses your prior support experience; they can lead to systems engineering and technical customer work, but may involve stressful customer SLAs.

• Embedded Linux consulting/design roles preserve direct engineering work, but require stronger low-level software proof and generally provide less hand-holding.

• Remote electronics/hardware bring-up roles are rarer because they require lab equipment, physical target boards, supplier samples or manufacturing travel. No fully Tunisia-confirmed pure hardware design vacancy was verified in this search.

• A lower-responsibility role with better pay and more predictable hours can be a rational short-term move, provided your long-term technical path remains open.

Interview likelihood and offer percentage: cannot confirm

No trustworthy employer-published data in the reviewed sources supports assigning you an “8%,” “20%” or “65%” acceptance chance. The employer’s applicant pool, recruitment headcount, interview performance, degree and exact years of work are unknown. The readiness index gives a relative screen, not a measured hiring outcome.

09 / Excluded or deprioritized vacancies

These illustrate why “remote” cannot be trusted without reading the source. They are not included in the ranked count.

Bootlin — Embedded Linux / Kernel Engineer

Offers remote work, but employer specifically states French work permission / remote France or EU arrangements. Not verified Tunisia-eligible. Source / check

Canonical — Software Engineer, Ubuntu Server Certification

“Home Based — Americas”; good hardware validation domain, but location excludes Tunisia under stated team scope. Source / check

Canonical — Dedicated Linux Desktop & Devices Support Engineer, Singapore

Home Based — APAC; not a Tunisia remote match. Source / check

Imagine Worldwide — Android Systems Engineer

Remote Africa-preferred, but the employer specifies 5+ years and extensive MediaTek/AOSP/Android BSP experience; not a high-readiness choice. Included as Tier C only. Source / check

Canonical — graduate intake

The 2026 graduate intake targets 2025/2026 graduates; unknown graduation year means eligibility must be checked. Included as conditional Tier C only. Source / check

Numerical U.S. remote embedded salaries

USD $100k+ listings often require U.S. work authorization, location and/or clearance; they are inappropriate as Tunisia expected-pay proxies. Source / check

How to confirm eligibility in one email

Reusable recruiter message

Hello, I am an embedded systems engineer based in Tunisia with experience in C/C++, Yocto/Ubuntu, STM32 and hardware/software debugging, and English at C1 level. Your position is advertised as remote. Could you confirm whether a Tunisia-resident applicant can be hired or contracted without relocation, and whether equipment or international travel is required? I would also appreciate the salary range and whether it is gross or net. Thank you.

10 / Source register — verified official applications

Each role links directly to its source in the detailed profiles. This register provides an independent click-through checklist. An employer application page being visible does not establish its closing date.

Salary benchmark sources and specific limitations

Levels.fyi — Software Engineer in Tunisia (30 submissions; 19 Oct 2026): open

Glassdoor — Embedded Software Engineer salary in Tunisia (estimates; mixed page metadata): open

Paylab — Software Engineer pay distribution in Tunisia, gross: open

Collabora own careers listings (cross-check active vacancies): open

Igalia current vacancies (cross-check remote career track): open

Canonical open roles (cross-check job list): open

Verification standard and freshness

Research was performed for a 20 October 2026 snapshot. Primary pages are employer-owned. Individual Tunisia hiring eligibility is not independently confirmed unless a job explicitly says so (none of the listed 18 pages specifically promises Tunisia). Salary totals are reported with their unit (gross/net/annual/total comp), and editorial readiness scores are not statistical acceptance odds.
